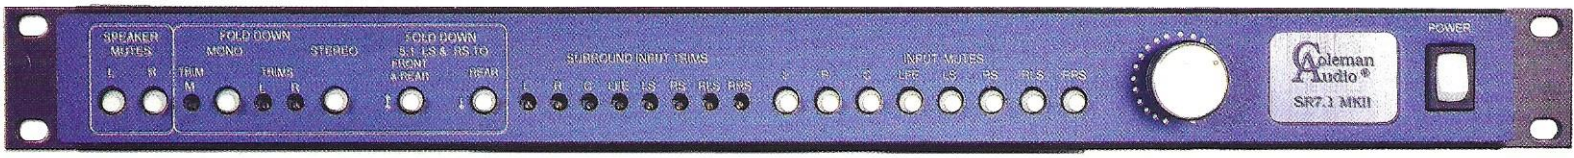
COLEMAN AUDIO SURROUND MODULES

SR5.1MKIII Surround Level Control

The SR5.1MKIII gives you true analogue electronics for your surround mixes. The 47 position stepped attenuator tracks to .05db through out its range assuring that the balance for all the speakers is maintained at any level. There are fold down switches for stereo and mono to check the phase and stereo compatibility of any surround mix. Inputs are on combo jacks so either a XLR or a TRS 1/4" plug can be used. Each input has a mute switch and a trim control that is accessible on the front panel to adjust gain or fine tune the balance of the speaker system. All inputs and outputs are balanced.

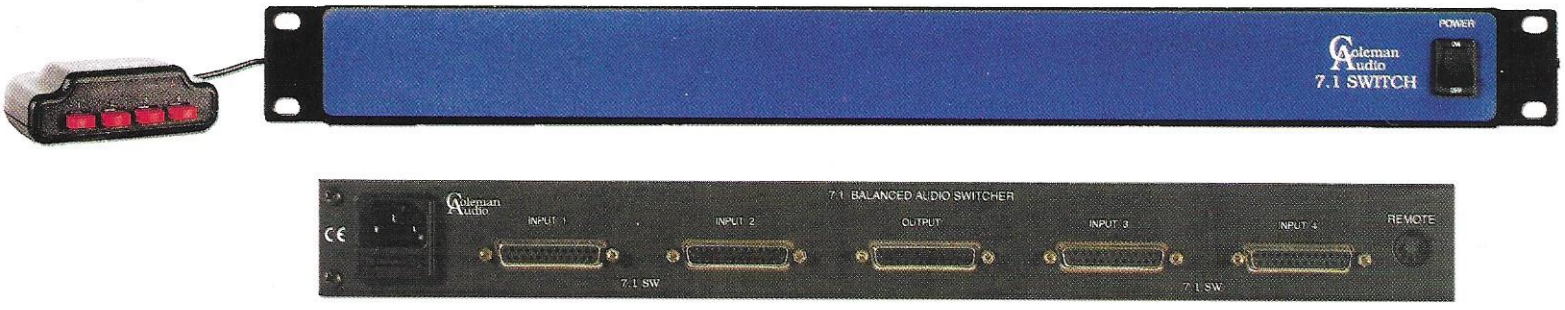
A/B5.1 Surround Switcher

The A/B5.1 surround switcher can be used to compare any two surround sources (ie DAW to DVD or if you are trying to match last weeks mix. Since it is bidirectional switcher it could be configured as a surround alternate speaker selector. There are three groups of input/outputs on TRS 1/4" jacks. These can be connected as two inputs to one output (comparing surround sources) or one input switching between two outputs (for alternate speakers or different locations). All inputs and outputs are balanced and the switching is done with relays so there are no electronics in the audio signal path. A mini jack on the back panel is for remote switching capability.



SR7.1MKII Eight Channel Level Control

The SR7.1MKII can be used for a variety of applications. Whether you are mixing in a 7.1 format, a 5.1 format or using it as a summing box, the analogue electronics will deliver. The 47 position stepped attenuator tracks to .05db to maintain the balance at any level. An internal switch will route the mono fold down to either the center speaker or the stereo speakers. A second internal switch allows the LFE channel to be in the stereo & mono fold down. The inputs and outputs are balanced on DB25 connectors. Individual input mutes to isolate speakers and level trims for each channel are on the front panel.



7.1SW Surround Switcher

The 7.1SW is a 4 by 1 bidirectional eight channel switcher. The remote selects any of four separate inputs and routes the eight channels to one output. The inputs & outputs are on DB25 connectors for easy connections. Switching to compare 7.1 game audio files, 7.1 film mixes, sending a 5.1 mix plus a stereo simultaneously, or authoring a DVD from separate 7.1 sources this routing system has many uses. The 7.1SW is bidirectional so it can feed one source to any of the four outputs.
