

To change a single Preamp/EQ card, the Rear Connector assembly can be positioned to avoid the interference from the half-round cover plate (See #2). If more than 1 card is to be serviced, it is recommended that the side-panels + Rear Connector be positioned out of the way for easier service (See #1).

#1:
To gain easier access to the Preamp/EQ cards, remove the screws holding both side-panel/mounting ears to the Main chassis. Then, keeping the rear connector still connected to the ears, the entire assembly (side ears + rear connector) can then be positioned up and to the rear and out of the way; the cards can then be easily removed.

Rear Connector Assembly

Remove these 4 screws to release the support bar holding the Preamp/EQ cards in place. The cards can then be pulled straight out from the Main Board.

Rear-chassis ground wire

Stereo Channel
Preamp/EQ Cards (4)

Mono Channel
Preamp/EQ Cards (12)

#2:
Half-round (metal) cover plate. This is attached to the Rear Connector and can interfere with removing the Preamp/EQ cards. Rotate the Rear Connector to gain clearance here.
