P. W. BOARD OF KU-5010 MOTOR DRIVE UNIT 17
PARTS LIST OF P. W. BOARD 17

FEATURES

1. Microprocessor controlled, contactless servo tonearm

A unique microprocessor controlled, contactless servo tonearm ensures safe, easy to use automatic operation with no deterioration in sound quality.

2. Q-damping method (Dynamic servo tracer)

Low frequency resonance caused by the cartridge compliance and the effective tonearm mass is electronically damped both horizontally and vertically to effectively suppress crosstalk and inter-modulation distortion. The dynamic servo tracer maximizes the performance of the low mass tonearm and results in a record reproduction of excellent sound image with minimum noise and distortion.

3. Low mass straight arm

Having an outstanding tracing ability, this arm maximizes the performance of the high compliance cartridge to the full extent. Even with the most up-to-date high grade records, its tracing ability is excellent.

4. Locate function

Just by pressing the locate button, the tone-arm is moved to any desired location where the record play is started.

5. Record size detector and automatic speed selector

The record size and the speed are automatically set, when playing 12 inch records (33 1/3 rpm) or 7 inch records (45 rpm) in the automatic play mode. The unit provides a safety measure which causes the tonearm to stop and return to the arm rest to protect the stylus tip when there is no record on the turntable, even if the start button is pressed.

6. DENON quartz on bi-directional servo

Bi-directional servo and electronic braking system have been added to the combination of the magnetic recording detector and the quartz lock to ensure a stable performance of ratation and a sharp operation.

7. Finely-finished wood cabinet design

Mirror-like finish, large cabinet with 85 mm in height, and a new howling-proof insulator have been incorporated into the DP-47F.

8. Newly-developed high-output MC cartridge (for U.K. model only)

The DP-47F is equipped with a high-output MC cartridge DL-80MC which has a superb tracing capability and resolution and it allows a clear sound to be reproduced.

9. Newly-developed cartridge (for European model only)

A high-output MC cartridge comparable to MM cartridges. The DL-160 MC cartridge can be connected directly to the MM position of the amplifier.

Note:
- U.S., Canadian & Asian models do not include cartridge.
- U.K. model includes the DL-80 MC cartridge.

SPECIFICATION

MOTOR

Drive System:	Servo controlled direct drive
Turntable Speeds:	33-1/3, 45 rpm
Wow & Flutter:	Below 0.010% wrms (servo system) Below 0.020% (JIS)
S/D Ratio:	Over 78 dB (DIN-B)
Rise Time:	Nominal speed within 2 seconds (at 33-1/3 rpm)
Turntable Platter:	Aluminum die-cast; 310 mm diameter
Motor:	Linear drive motor
Speed Control System:	Speed servo by frequency detection, phase servo control
Speed deviation:	Below 0.01%
Load characteristics:	0% (80 g tracking force; outermost groove)

GENERAL

Power Supply:	50/60 Hz, Voltage is shown on rating label
Power Consumption:	Approx. 8 W
Dimensions:	434 x 179 x 410 mm (W x H x D) 17 x 7.3 x 16.1 in
Weight:	Approximately 8.5 kg (19 lb)

TONEARM SECTION

Arm Type:	Dynamically balanced, straight tube tonearm
Effective Length:	220 mm
Overhang:	16 mm
Tracking Error:	Within 3°
Automatic Mechanism:	Electronically controlled, fully automatic
Adjustable Tracking Force Range:	0 ~ 3.0 g (1 scale = 0.1 g)
Suitable Cartridge Weight Range:	Approximately 3.0 ~ 12.0 g (including screws, nuts)

CARTRIDGE	**DL-80MC**	**DL-160 (European model only)**
Output Voltage	1.6mV	1.6mV
Frequency Response:	20 Hz ~ 45 kHz	20 Hz ~ 45 k Hz
Tracking Force:	1.8 ± 0.3 g.	1.8 ± 0.3 g.
	High-output MC type	High-output MC type

U.S., Canadian and Asian models do not include cartridge.

*For product improvement purposes, the specifications are subject to change without notice.

WARNING:

1. Component parts

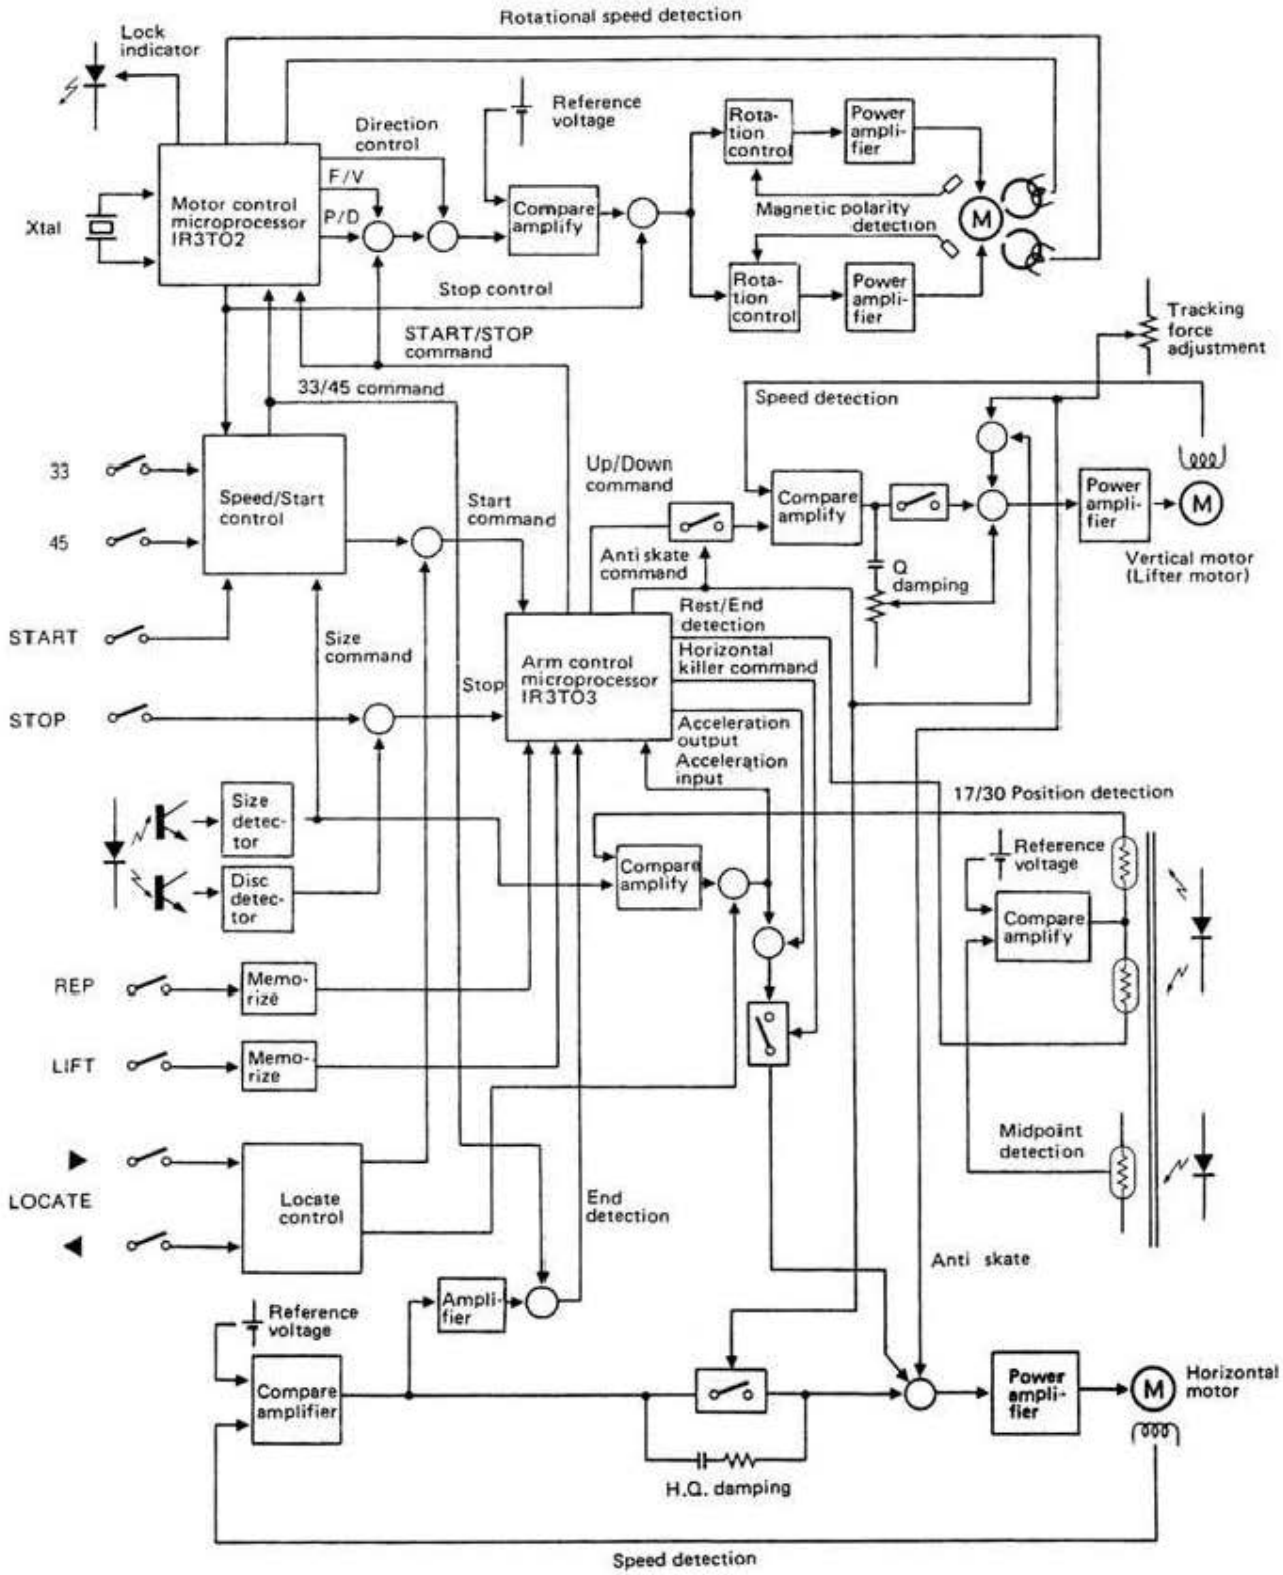

Parts marked with ⚠ and/or shading in this service manual have special characteristics important to safety. Be sure to use the specified parts for replacement.

2. Leakage current

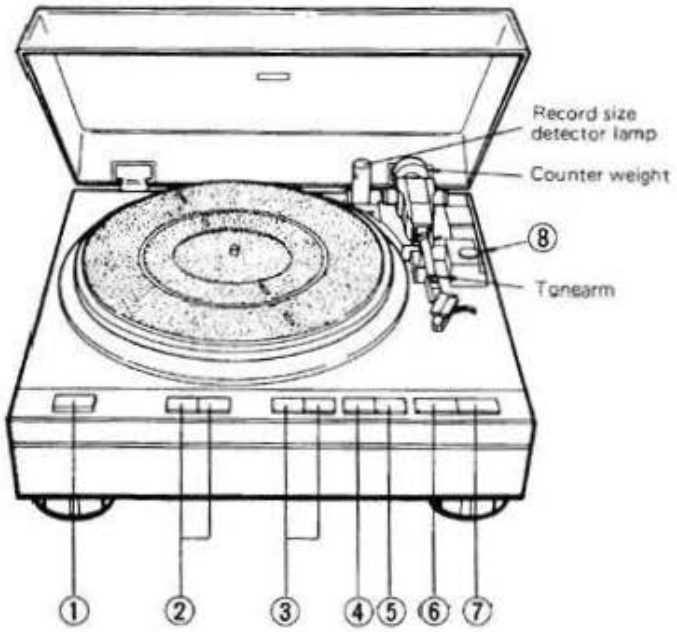

Before returning the appliance to customer, test the leakage current when the power plug is connected. Use a calibrated (with an error of not more than 5%) leakage current tester and measure the leakage current from any exposed metal to the earth ground. Reverse the power plug polarity and test the above again.

Any current measured MUST NOT EXCEED 0.5 miliamps. Corrective measure must be taken if it exceeds the limit.

BLOCK DIAGRAM

PART NAMES AND FUNCTION

1. Power switch POWER
This switch is used to turn on or off power. Press this button to allow the record size detector lamp to light up. For turning off power, move the arm back to the arm rest, clamp it, then press that button again.

2. Speed button 33. START/LOCK. 45
For playing records manually, press the button corresponding to the record speed.

33 1/3 rpm records . . . . . (33.Start)
45 rpm records . . . . . (45. Start)

In the automatic play mode, the switch will automatically be set to "33" for 12 inch records and "45" for 7 inch records.

The Speed Indication lamp also shows the "LOCK" indication and it keeps blinking until the turntable reaches a specified number of rotations, when it lights up again.

3. Locate button LOCATE
Use this for moving the tone arm horizontally to the position from which you wish to start playing.

4. Arm Lifter button UP LIFTER
Press this button to raise or lower the tonearm during play, or when playing records manually. The "UP" indicator will light up.

5. Repeat button REPEAT
Press this button for playing the same record repeatedly: the "ON" indicator will light up.

6. Start button START
Press this button to start records automatically.

7. Stop button STOP
Press this button to stop a record during play.

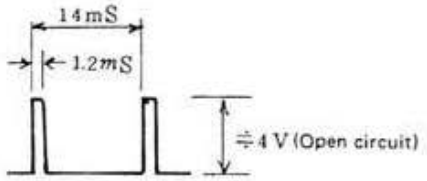

8. Tracking force adjustment knob TRACKING FORCE/ANTI-SKATE
Operate this knob for adjusting the tracking force. The anti-skate and Q damping are adjusted simultaneously.

EXPLANATION OF THE MICROPROCESSOR

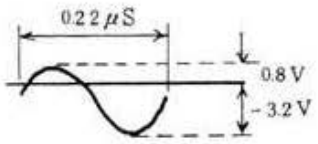

- **Motor Control IC ... IR3T02 (at standard revolution of 33 rpm)**

The numbers on the left hand size indicates the terminal number.

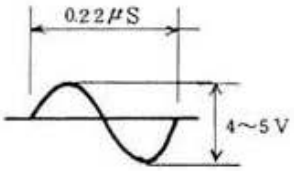

1. Strove drive

2. 4.5MHz OSC

3. 4.5MHz OSC

4. rpm selector

H: 45 rpm
L: 33 rpm

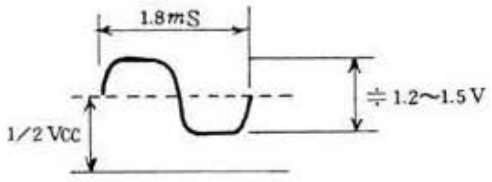

5. Power source input

Vcc: 5V ± 0.5V

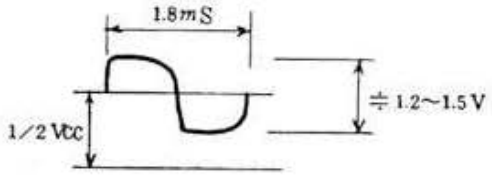

6. FGI bypass terminal

E6 = ½Vcc

7. FGI lowpass terminal

8. FG I output

9. FG I inverse input

The gain set element is connected
E9 = ½Vcc

10. FG I non-inverse input

10mVpp ~ 100mVpp
E10 = ½Vcc

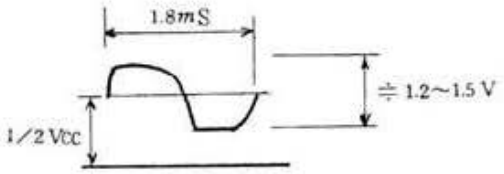

11. FG II non-inverse input

10mVpp ~ 100mVpp
E11 = ½Vcc

12. FG II inverse input

The gain set element is connected.
E12 = ½Vcc

13. FG II output

14. Ground terminal

15. F/V output

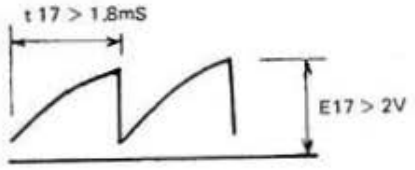

slower than normal revolution: 2 ~ 4.5V
normal revolution: ≒2V
faster than normal revolution: 0 ~ 2V

16. F/V hold terminal

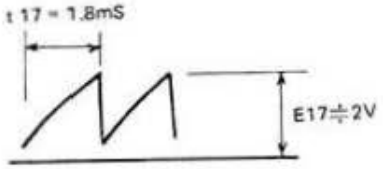

same as terminal 15

17. F/V triangular wave

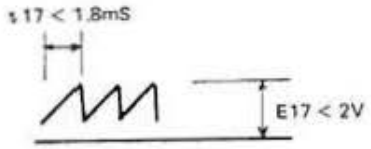

slower than normal revolution

normal revolution

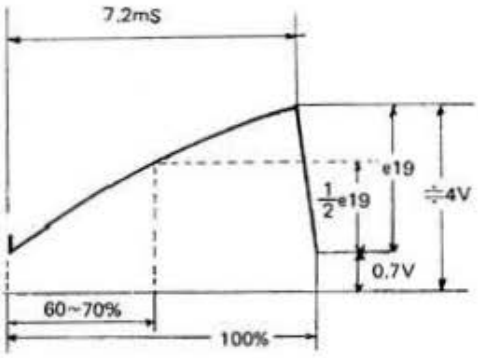

faster than normal revolution

18. Timing pulse width-set terminal

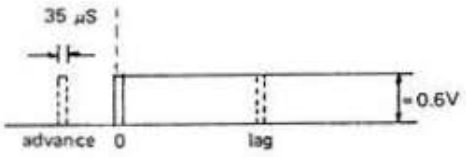

E18 = 0.6V

19. PD triangular wave

Note:
PD: Phase Detector

20. Sample pulse monitor terminal

21. PD hold terminal

slow phase: 2 ~ 4V
normal phase: ≒2V
advanced phase: 1 ~ 3V

22. PD output

same as terminal 21

23. Lock detector time set terminal

during lock: 0.6V
lock disengaged: 0V

24. Direction detector output

normal revolution: 0V
reverse revolution: ≒ 4V

25. Revolution detector

during revolution:  ≒4

stop: 0V

26. START/STOP terminal

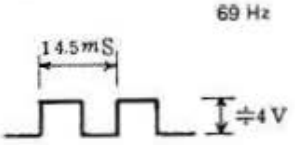

H → START
L → STOP

27. Stop output

during stop control: 0V
during start: open

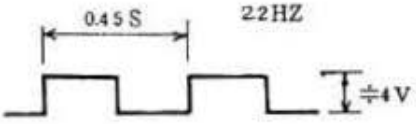

28. Lock indicator

during lock ..... (LED lit dimly)

stop ..... (LED lit)

during transition .. (LED flashes)

• Arm Control IC IR3T03

The numbers on the left side indicates the terminal number of the IR3T03.

1. Acceleration input

Except for the matching range of the lead-in detector (E7 ≦ |±0.6V|), it will recognize the situation and control the acceleration during automatic tonearm operation.

2. Acceleration output

E1 ≦ |±2.37V ±0.1V| . . . . open (will not control the acceleration within the matching range)

E1 ≧ |±2.37V ±0.1V| . . . . E2≒±3.95V

−3.95V: will accelerate toward the inside from rest.

+3.95V: will accelerate toward rest from the inside.

3. UP/DOWN selection of the arm lifter

When E9 is H, the control output for lifting the arm will be made at E3≒−Vcc.

When E9 is L, the control output for lowering the arm will be made at E3≒+Vcc.

4. Detection of the rest position

E4 ≦ −2.64V will be recognized as the arm being at rest.

5. Detection of the END position

When E5 ≧ 2.64V, it will be recognized to be within the END detection range.

6. End control

Within the END detection range of 5 (above), (E5 ≧ 2.64V), the arm will be returned by the END control when E6 ≧ 0.23V.

7. Matching input

E7 ≦ |±0.6V| will be recognized as the match range for lead-in.

8. Drive output

Connect to GND.

9. UP control output

When the lifter is in the UP position during automatic arm operations or when the UP signal is sent by pressing the arm lifter button, pin 9 will be at H level.

E9H≒4V

E9L≒0V

10. DOWN time constant

To ensure that the arm is lowered completely before proceeding to the next movement, a resistor between pins 9 and 10 and a capacitor on pin 10 has a preset discharge time constant which is somewhat longer than the time required for the arm to be lowered. Thus, when pin 9 becomes L (E9L ≒ 0V), and the fixed amount of time elapses, the arm will be recognized to be DOWN as soon as E10 < 2V.

11. ANT (Anti-skating) control

When E10 < 2V, then E11 ≒ −4V will be the control output needed for the anti-skating to be engaged.

When E10 ≧ 2V, then E11 ≒ +4V will be the control output needed for the anti-skating to be disengaged.

12. Negative power source

Supplies −5V.

14. SUB (substratum)

To prevent any interference from the inner elements of the LSI, the substratum terminal is connected to the unregulated side of the negative power source, since it has the lowest electric potential.

15. GND

Standard zero electric potential is the GND.

17. Return control

When the stop command is given, or when the repeat is disengaged and the END is detected (E6 ≧ 0.23V), a control signal output (E17H > 4V) is made to return the arm to rest.

E17H > 4V

E17L: release

18. Horizontal drive control

When the arm is in resting position, or when the arm reaches the lead-in position during automatic play, and comest into the matching range (E7 ≦ |±0.6V|), a control signal output (E18H ≒ 4V) is made to stop the horizontal motion of the arm.

19. Initial set

This is the preparation time setting terminal when the power source is turned on. The resistor in the LSI and the outer capacitor will set the charge time constant and carry out the initial set.

20. LCTD (Located) time constant

The LSI and its outer circuits will set the LCTD time constant to improve the detection accuracy of the lead-in position and the arm rest position.

E20H≒1.2V . . . . A few moments after the arm reaches the range of detection, in other words, after the set LCTD time constant elapses, it will become H level, where it is memorized immediately and then reset to the L level.

E20L≒0V . . . . . Before and after detection, it will become L level.

21. Turntable (T/T) Drive Control

E21L≒0V . . . . . the turntable stops
E21H release . . . . the turntable rotates
(refer to the operational explanations for pin 22)

22. Turntable (T/T) Start Position

This terminal establishes the turntable start position. The turntable will start when the arm separates from the arm rest and pin 22 is released, under manual and auto modes.

23. Start

Will start automatically at the GND level.

24. Auto stop

Will stop automatically at the GND level.

25. Lifter

Will raise the lifter automatically at the GND level.

26. Repeat

Will engage the repeat automatically at the GND level.

27. UP SW

When the arm lifter is raised, this terminal will be opened and made H level, otherwise, the UP detector will control it to make it GND level.

28. Positive power supply

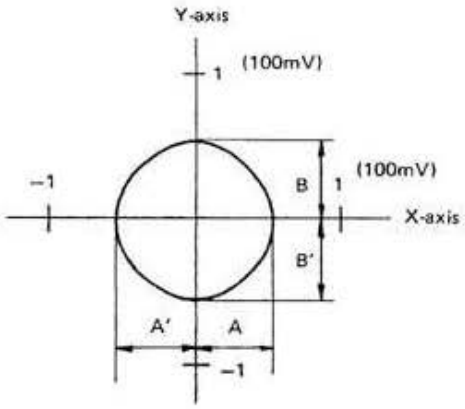

Supplies +5V.

ADJUSTMENT METHOD

• PHONO MOTOR ADJUSTMENT

1. Off-set adjustment

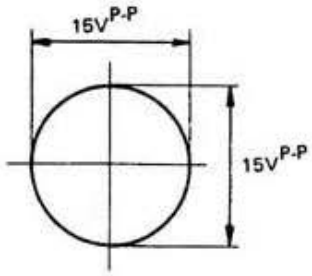

1) Set the X-axis and Y-axis sensitivity of the oscilloscope to 100mV/cm by using a 10:1 probe.
2) Connect the X-axis terminal of the probe with TP-203 on the motor drive base board and the Y-axis terminal of the probe with TP-204. Use pin No. 8 as the ground.
3) Connect pin No. 5 and pin No. 8 and make a low resistance circuit on the input terminal.
4) Stop the rotor at the maximum position of the X-axis amplitude of the Lissajous' figure of the oscilloscope while turning the motor by hand.
5) Set the maximum amplitude at the X-axis by adjusting VR-201. A = A'
6) Stop the rotor at the maximum position of the Y-axis amplitude of the Lissajous' figure.
7) Set the maximum amplitude at the Y-axis by adjusting VR-202. B = B'
8) Adjust the center of the circle to ± 50mV.

9) Disconnect pin No. 5 and pin No. 8 after adjutment.

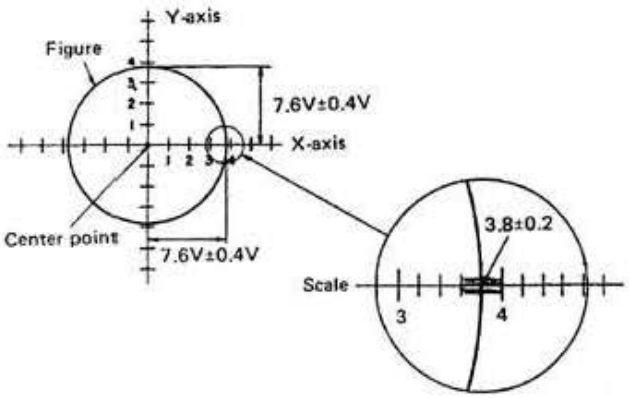

2. Amplitude adjustment

1) Check the X-axis and Y-axis sensitivity of the oscilloscope by using ± 5V power supply.
2) Cover the photo transistor of the size detecting light receiver with a black rubber sheet or something to avoid that light enters.
3) Remove the arm from the arm rest and remove the turntable. Then, turn the motor with full speed.
4) Set the amplitude of the X-axis and Y-axis of the Lissajous' figure to 15 VP-P by adjusting VR-203 and VR-204. Make sure that there is no voltage difference between the X-axis and the Y-axis.

3. Center adjustment

1) Adjust the X-axis and Y-axis sensitivity of the oscilloscope to 2V/cm.
2) Set the amplitude of the X-axis and Y-axis of the Lissajous figure to exactly the same point from the center by adjusting VR-205 and VR-206. After the adjustment, the amplitude should be as shown in the figure below.

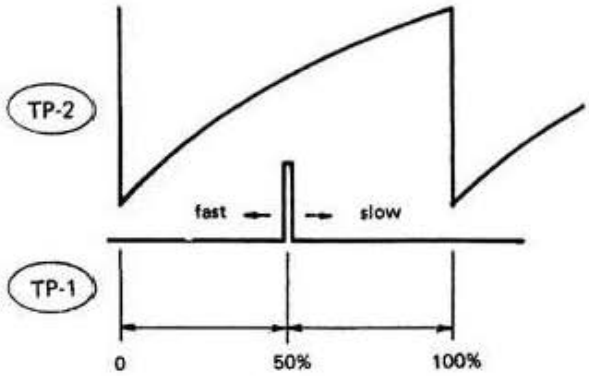

4. Adjusting the head gap

Adjust, so that the gap between the turntable magnetic coating surface and the detection head is 0.18 mm.

5. Lock adjustments for 45 rpm

Hereafter, the earth reference point of the measuring instrument should be connected to wrapping terminal 42 of the servo control circuit board.

1) Connect the two-channel oscilloscope to TP-1 and TP-2.
2) Set the speed selector to 45 rpm.
3) Take the arm off the arm rest and move it toward the turntable to rotate the phonomotor.
4) Adjust VR-1 so that the pulse from TP-1 is positioned to 50% of the triangular wave length from T.P. 2.

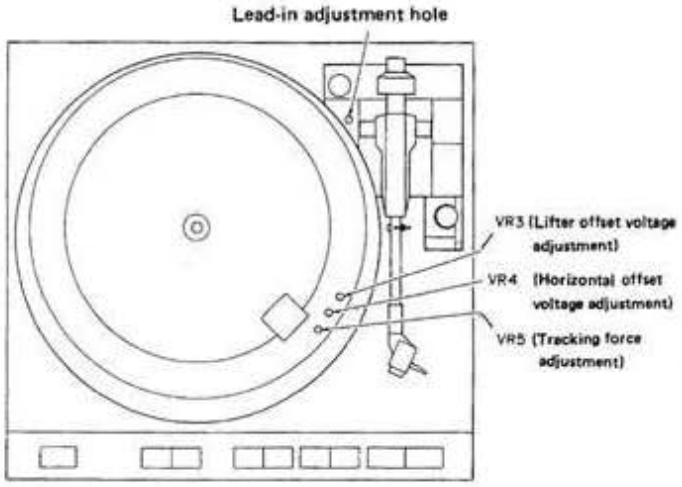

6. Lock adjustments for 33 rpm

1) Connect the oscilloscope in the same manner as the 45 rpm lock adjustments. Set the speed selector to 33 rpm.
2) Make sure that the sampling pulse is positioned between 40% and 80% of the triangular wave length.

NOTE:

Phase lock position for 33 rpm is fixed (relative to 45 rpm) by R12 (metal film resistor).

ADJUSTING THE ARM CONTROL SECTION

1. Adjusting the horizontal OP amp. offset voltage

1) Fix the tonearm to the arm rest and connect the oscilloscope to TP-6.
2) Set the lifter switch to the UP condition.
3) Turn VR-4 and adjust to 0V±0.01V.

2. Adjusting the lifter OP amp. offset voltage

1) Fix the tonearm to the arm rest and connect the oscilloscope to TP-5.
2) Set the lifter switch to the DOWN condition.
3) After about 7 seconds, adjust to 0V±0.01V by turning VR-3.

3. Adjusting the tracking force

1) Turn the power supply switch OFF.
2) Take the arm off the arm rest. Rotate the balance weight so that the tonearm becomes parallel to the turntable surface when let go.
3) Return the arm to the arm rest and turn the power supply switch ON.
   (Note) Cover the size detecting photo transistors (2 pieces) with a rubber sheet or something to avoid that light enters.
4) Wait seven seconds after the arm has lowered. Place the cartridge stylus tip onto a stylus force gauge and set the stylus force adjustment knob to 1.5 g.
   (Note) At this time, the stylus tip height should be adjusted so that it is about the same height as during play.
5) Turn VR-5 and adjust, so that the stylus force gauge reads 1.5 g. (Turn VR slowly.)

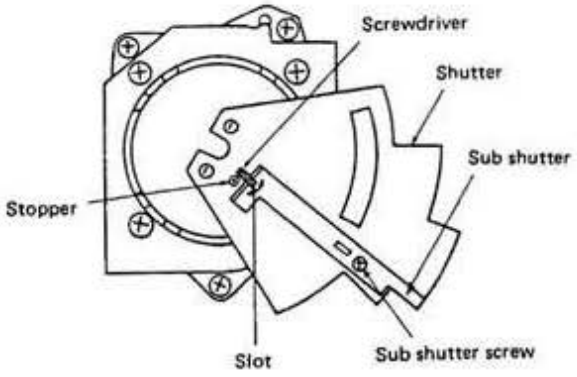

4. Adjusting the 30 cm lead-in position

1) Place a 30 cm record on the turntable and set the record size selector switch to "30".
   (Note) Keep the bottom cover closed.
2) Move the arm so that the stylus tip is at approximately the 30 cm lead-in position. Insert a small flat-headed screwdriver into the lead-in adjustment hole; move the arm back and forth and fit the screw driver into the groove of the cam inside gently.
3) After turning the screwdriver, pull it out once. Press the start switch and adjust so that the stylus position stops at the 30 cm lead-in position.
   (Note) The 30 cm lead-in adjustments cannot be performed unless the stylus tip position is approximately in the 30 cm lead-in position. In addition, if the screwdriver is left inserted, the arm will not move.

5. Adjusting the 17 cm lead-in position

Adjust as necessary, such as when parts of the sensor section have been replaced.
However, the following procedures should only be used when a discrepancy is found for the 17 cm lead-in position, after the 30 cm lead-in position has been adjusted.

1) Set the record size selector to 17 cm.
   (Note) The size is automatically changed by placing a 17 cm record on the turntable.
2) By continuously pressing the start switch, the arm will move over and stop. At this time, check now many millimeters, toward the inside or outside, the stylus tip deviates from the required 17 cm lead-in position.
3) Take off the bottom cover of the cabinet and check the adjustment scale position of the shutter. (One adjustment scale corresponds to a stylus tip movement of 0.5 mm.)
4) Untighten the screw holding the sub shutter and place a small flat-headed screwdriver into the slot of the shutter. When the stylus position is toward the inside, compared to the required position, move the sub shutter toward the right of the scale; when the stylus position is toward the outside, move the sub shutter toward the left. When completed, tentatively tighten the screw holding the sub shutter.
5) After the adjustments are made, press the start switch and check whether or not the stylus stops at the 17 cm lead-in position.
6) If the stylus stops at the required position, then tighten the sub shutter screw.

SCHEMATIC DIAGRAM

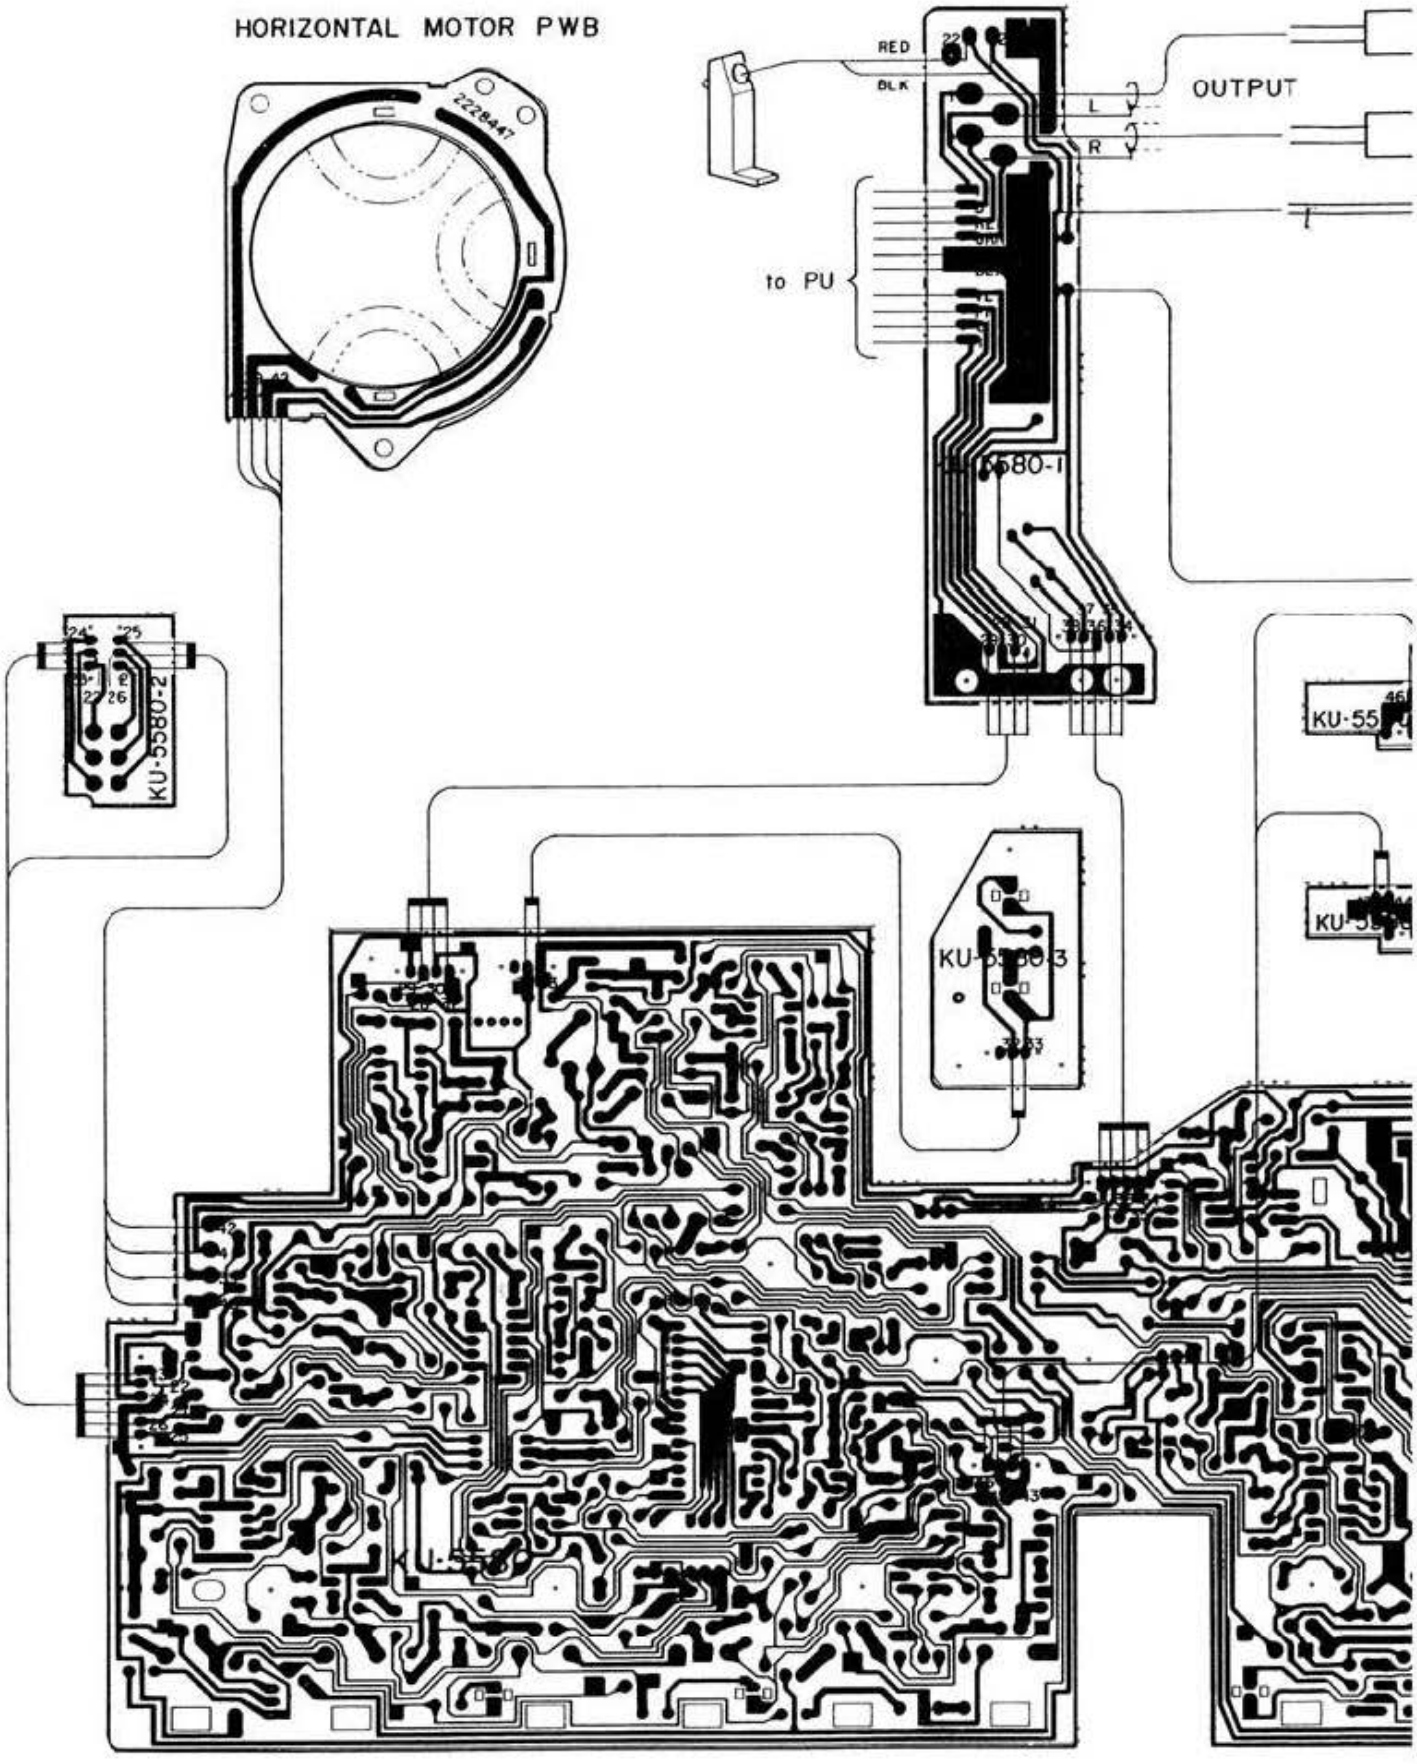

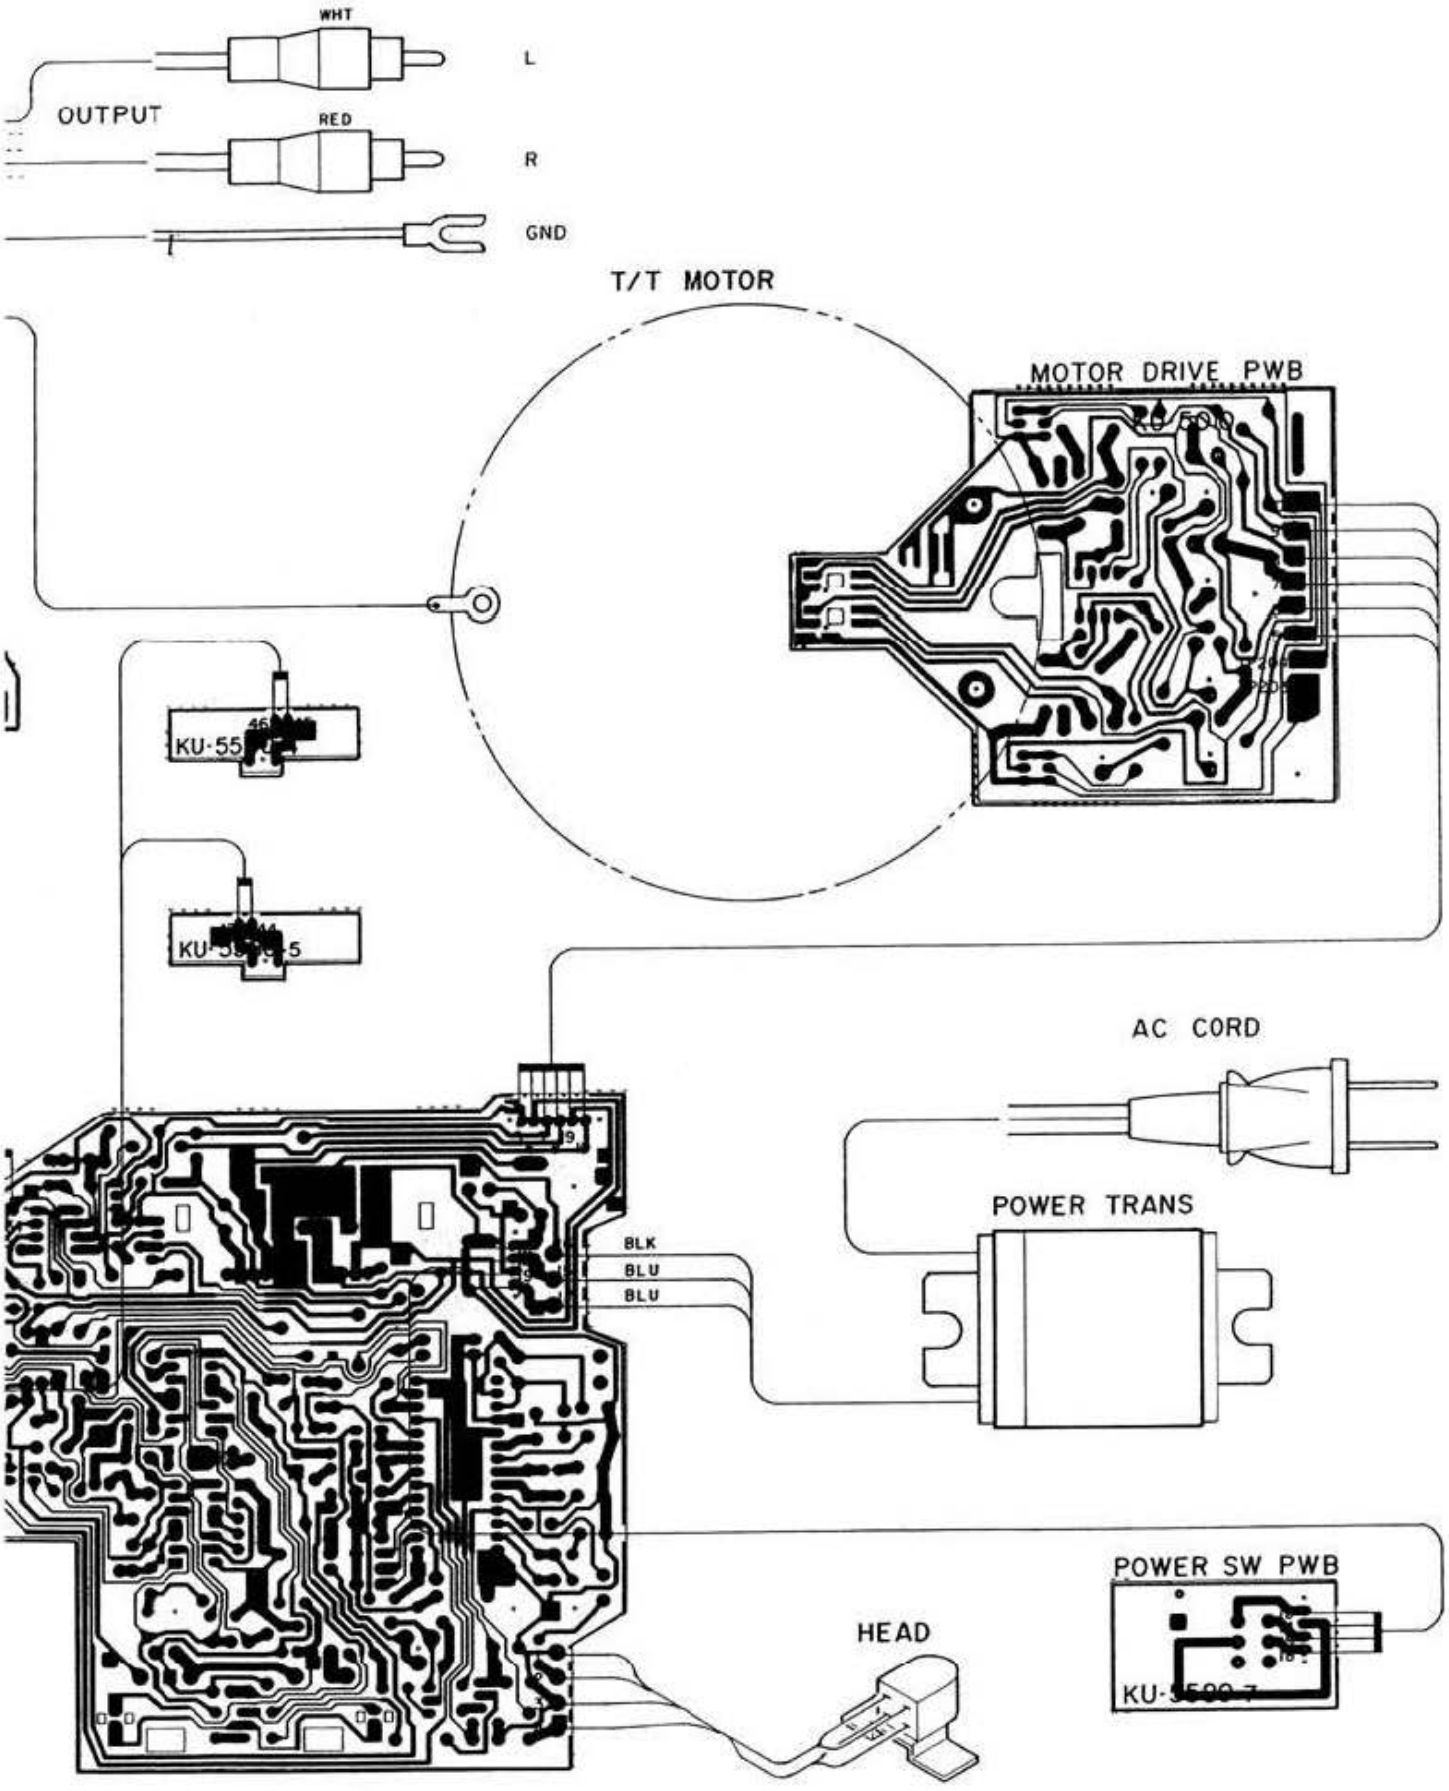

Note:

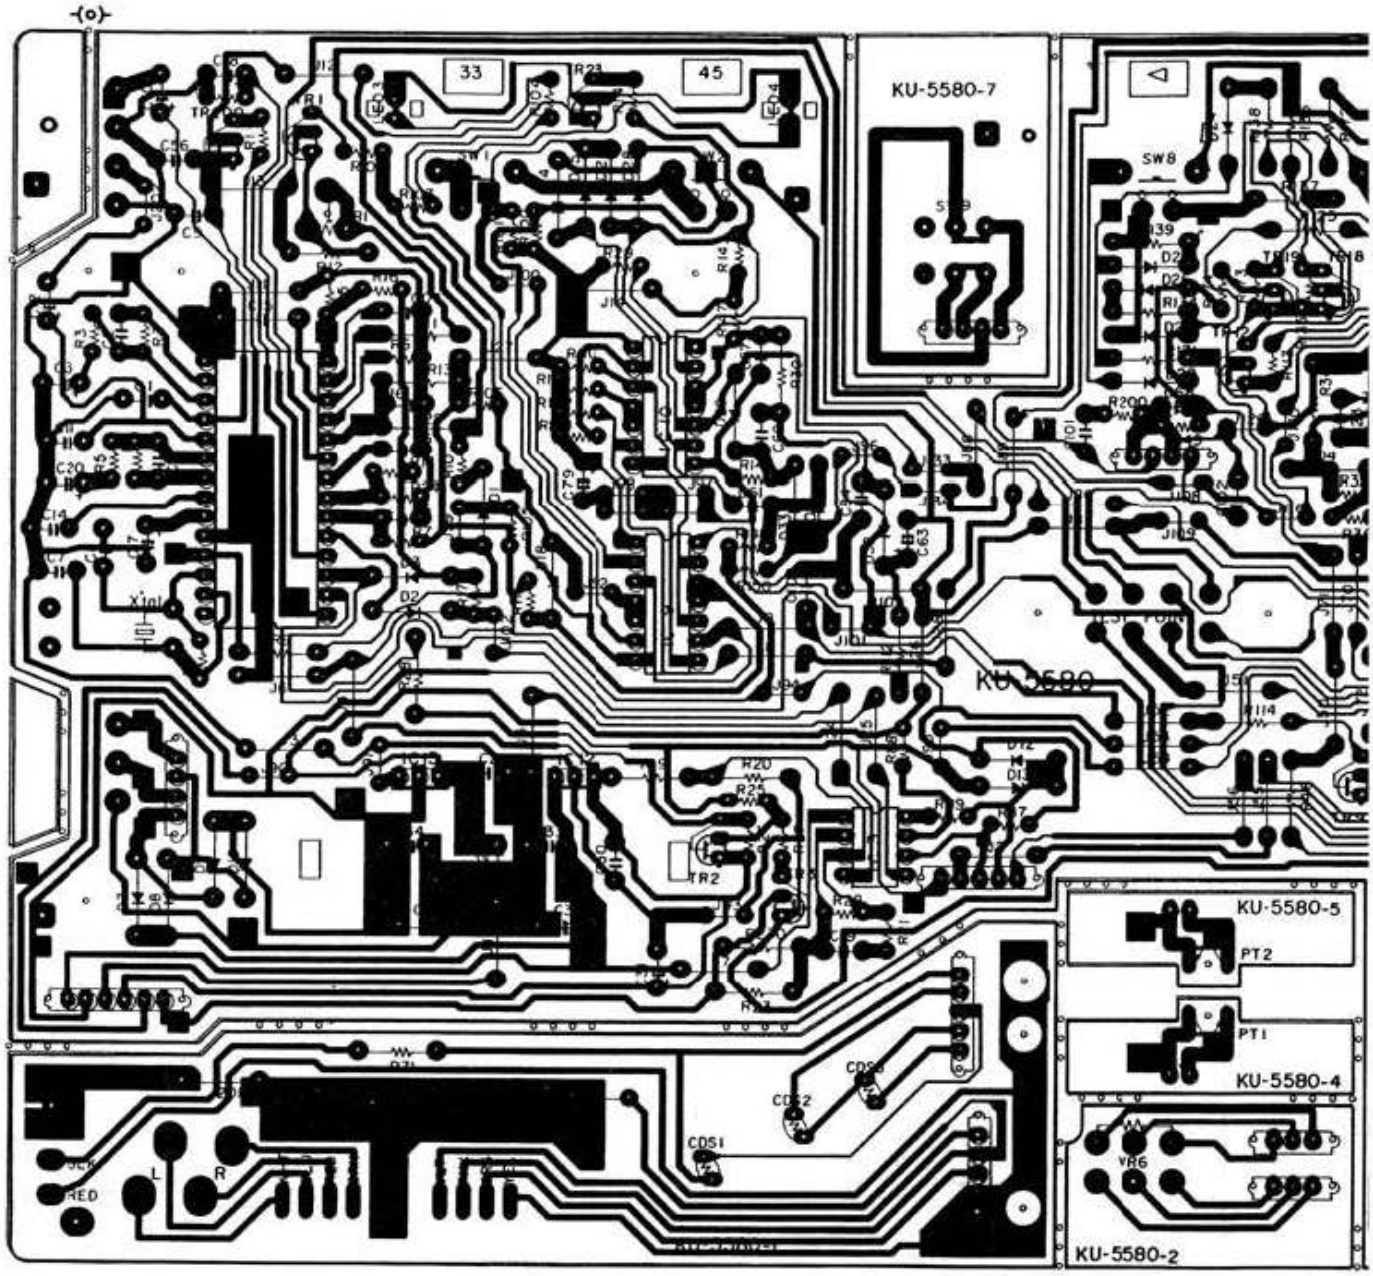

- Resistance shall be 1/4W unless otherwise specified and the unit is Ω.
- The unit of capacitor is μF, P is pF unless otherwise specified.
- This circuit diagram shows the basic circuit. It is subject to change for the purpose of improvement.
- Parts marked with ⚠ are of importance in respect to the safety, use the specified type without fail.
